

HTTP - HyperText Transfer Protocol

WASA: Web and Software Architecture

Prof. Emanuele Panizzi

HTTP - HyperText Transfer Protocol

- Application layer protocol in the Internet protocol
- Invented by **Tim Berners-Lee** @ CERN 1989-1991
- HTTP/3 published in 2022
- secure variant named HTTPS

Version	Year introduced	Current status
HTTP/0.9	1991	Obsolete
HTTP/1.0	1996	Obsolete
HTTP/1.1	1997	Standard
HTTP/2	2015	Standard
HTTP/3	2022	Standard

Client

- **User Agent (UA)**: any of the various client programs that initiate a request (e.g. web browser, mobile app, spider, household appliances,...)

Server

- **Origin Server (O)**: a program that can originate authoritative responses for a given resource (e.g. web site, traffic camera, office machines, video-on-demand platforms,...)

Request/response

```

      request  >
UA ===== 0
      <      response

```

Example – request

- Request line (HTTP-method URI protocol-version)
- Request header fields
- (optional) message body

```
GET /hello.txt HTTP/1.1
```

```
User-Agent: curl/7.64.1
```

```
Host: www.example.com
```

```
Accept-Language: en, it
```

Example – response

- completion status (about the request)
- (may contain) content

HTTP/1.1 200 OK

Date: Mon, 27 Jul 2009 12:28:53 GMT

Server: Apache

Last-Modified: Wed, 22 Jul 2009 19:15:56 GMT

ETag: "34aa387-d-1568eb00"

Accept-Ranges: bytes

Content-Length: 51

Vary: Accept-Encoding

Content-Type: text/plain

Hello World! My content includes a trailing CRLF.

chain of connections

E.g. Proxies, gateways, tunnels.

A store of previous response messages.

> >
UA ===== *A* ===== *B* - - - *C* - - - *O*
 < <

- *O* must declare a response as cacheable
- proxies can cache responses
- tunnels cannot cache responses

HTTP Methods

- *GET*
- *HEAD*
- *POST*
- *PUT*
- *DELETE*
- *CONNECT*
- *OPTIONS*
- *TRACE*
- *PATCH*

Methods properties

SAFE

A method that has no side effect on the resource, i.e. it is 'read-only'. It can however change the state of the server in other ways (e.g. logs) *GET, HEAD, OPTIONS* and *TRACE* are safe.

IDEMPOTENT

Multiple identical requests with that method have the same effect as a single such request. *PUT* and *DELETE* are idempotent.

CACHEABLE

Methods that can allow a cache to store and use a response. *GET, HEAD,* and *POST* under some conditions, are cacheable.

PUT

- Create a new resource, specifying it in the request
- Replace a resource (when the URI exists, overwrite it with the representation in the PUT payload)

PUT */course-descriptions/web-and-software-architecture*

- **IDEMPOTENT**: any successive identical PUT request does not modify the resource
- Neither safe, nor cacheable

GET

- Request a representation of the state of a resource

GET */course-descriptions/web-and-software-architecture*

- **SAFE:** no changes to the resource
- **CACHEABLE:** response can be cached by an intermediary, and reused without asking for it to **O**; conditions (e.g. expire date, etc.) can be specified.
- Not idempotent

POST

- Create or modify a subordinate of the resource indicated in the URI. The URI identifies the resource that will handle the request.

POST */announcements/*

POST */announcements/{id}/comments/*

POST */users/{id}/email*

- The action might not result in a new resource.
- Response can be cacheable if specified.
- Not safe.
- Not idempotent! E.g. the first example above adds many new identical announcements if requested many times.

- Request that the origin server removes the association between the target resource and its current functionality

DELETE */courses/web-and-software-architecture*

- **IDEMPOTENT**: deleting an already-deleted resource does not produce any new effect
- It is neither safe nor cacheable

Method	Description
<i>HEAD</i>	Same as GET, but do not transfer the response content.
<i>CONNECT</i>	Establish a tunnel to the server identified by the target resource.
<i>OPTIONS</i>	Describe the communication options for the target resource.
<i>TRACE</i>	Perform a message loop-back test along the path to the target resource.

Properties of request methods

Request method ↕	RFC ↕	Request has payload body ↕	Response has payload body ↕	Safe ↕	Idempotent ↕	Cacheable ↕
GET	RFC 7231 ↗	Optional	Yes	Yes	Yes	Yes
HEAD	RFC 7231 ↗	Optional	No	Yes	Yes	Yes
POST	RFC 7231 ↗	Yes	Yes	No	No	Yes
PUT	RFC 7231 ↗	Yes	Yes	No	Yes	No
DELETE	RFC 7231 ↗	Optional	Yes	No	Yes	No
CONNECT	RFC 7231 ↗	Optional	Yes	No	No	No
OPTIONS	RFC 7231 ↗	Optional	Yes	Yes	Yes	No
TRACE	RFC 7231 ↗	No	Yes	Yes	Yes	No
PATCH	RFC 5789 ↗	Yes	Yes	No	No	No

e.g. *HTTP/1.1 200 OK*

- Describes the result of the request and the semantics of the response.
 - whether the request is successful
 - what content is enclosed (if any)
- Three-digit number in the range 100-599

Status code classes

status code	description
1xx	(Informational): The request was received, continuing process
2xx	(Successful): The request was successfully received, understood, and accepted
3xx	(Redirection): Further action needs to be taken in order to complete the request
4xx	(Client Error): The request contains bad syntax or cannot be fulfilled
5xx	(Server Error): The server failed to fulfill an apparently valid request

Common status codes - 2xx success

200 OK In a GET request, the response will contain an entity corresponding to the requested resource; in a POST request, the response will contain an entity describing or containing the result of the action

201 Created The request has been fulfilled, resulting in the creation of a new resource

204 No Content The server successfully processed the request, and is not returning any content

Common status codes - 3xx redirection

301 Moved Permanently This and all future requests should be directed to the given URI

302 Found (Previously “Moved temporarily”)
Look at another URL

Common status codes - 4xx client errors

400 Bad Request Apparent client error

401 Unauthorized Authentication is required

403 Forbidden The request contained valid data and was understood by the server, but the action is prohibited

404 Not Found Resource could not be found but may be available in the future

405 Method Not Allowed The request method is not supported; e.g., a PUT request on a read-only resource.

Common status codes - 5xx server errors

500 Internal Server Error Unexpected condition encountered

501 Not Implemented Unrecognized request method, or the server lacks the ability to fulfil the request

502 Bad Gateway A gateway or proxy received an invalid response from the upstream server

503 Service Unavailable Server overloaded or down for maintenance (temporary)

504 Gateway Timeout The server did not receive a timely response from the upstream server
